# FOR A SMART AND SUSTAINABLE PEST CONTROL

inPEST® is a GEA's Pest Management brand. A brand which is specifically designed for the Trained professional in the world of monitoring and IPM.

inPEST® wants to be a key brand in the world of sustainable / green pest control in Europe, ensuring hygiene and safety throughout the supply chain in the most effective way possible and in full respect of the environment.

## OUR CERTIFICATIONS

**UNI EN ISO 9001:2015**  
Quality management systems

**ISO 45001:2018**  
Occupational health and safety management systems

## A SINGLE NAME FOR TRAINING

Provides training courses for our three sectors

PROFESSIONAL  
MONITORING

HOME AND GARDEN

PROFESSIONAL  
AGRICULTURE

GEAforma aims to consolidate its role as your reference for trainings in the world of pest monitoring. Our training proposal offers high quality online and presential courses and professional development programs, aimed at enhancing the skills of those involved in the sector. An opportunity to grow professionally and to keep pace with market developments.

We offer specific course to help you reach your goals effectively. All training courses are organized following a strict quality standards certified by UNI ISO 21001:2018, ensuring maximum reliability.

## PHEROMONES AND SPECIFIC ATTRACTANTS

The images provided in this catalogue are purely indicative

# SPECIFIC PHEROMONES AND ATTRACTANTS

## Phero-Si inPEST

After years of research and innovation, the GEA R&D Team has achieved its goal of **optimizing** and **improving** silicone pheromone supports. The team's efforts led to the replacement of the previous device with a more **innovative** version: the new **"Phero-Si"** pheromone dispenser in PEST, made with ad-hoc silicone blend.

The new dispenser has a characteristic **cylindrical** shape, more **easy-to-handle**, with **more weight** and a **larger emission surface**.

The choice of the new silicone mould also made it possible to:

- **use a mixture more suitable for use in the food industry,**
- **improve the emission of pheromones with which the devices are loaded,**
- **increase effectiveness in the field, promptly detecting even the low presence of pests and returning a higher number of target catches,**
- **guarantee a better pheromone emission over time compared to para dispensers,**
- **create a fully metal detectable version of the device, "Phero-Si MD"**

**in PEST, by adding ferrite to the silicone blend. This technical aspect is increasingly important in food companies and required by the main certification standards (BRC, IFS, etc.).**

## Pheromones and specific attractants

**inPEST pheromone line** exploits the ability of insects to perceive specific semiochemical molecules (pheromones) to alter their behavior.

Due to reduction of insecticides and active substances on the market it is vital to find new techniques to face an ever demanding regulation, with the use of **integrated pest management (IPM)** in all its forms.

With this in mind, inPEST pheromone line gives the possibility of monitoring a large quantity of species reducing the environmental impact to the minimum. In inPEST pheromone line it is also possible to find pheromone dispensers for Mating Disruption Technique to face insects infestations by preventing their reproduction.

Some of the products in this section (Phero-Si silicone supports for pheromones) are available in the **metal detector version Phero-Si MD**.

The attractants in this section can contain allergens.  
For any enquiry please contact our Quality and Regulatory office or our sales team.

### Precautions of use:

To avoid altering the efficacy of the dispensers it is suggested to handle the products with gloves.

### Attention:

All the vials in this section must be used closed (as shown in the picture), for a better functioning.

### PHERO-SI PATCH FOOD GREEN

*Plodia interpunctella, Ephestia kuehniella, Ephestia elutella, Cadra cautella, Cadra figulilella*

# Mating disruption technique

The method consists of saturating the environment with overdoses of the sex pheromone that is normally emitted by the female of each specific targeted insect, to an extent that prevents the male from locating and fertilising the female.

## Objective:

Ridurre il numero degli accoppiamenti della popolazione infestante

## How?

By spreading a high quantity of synthetic pheromone, using high-dose dispensers. This is to interfere with the perception and response of the male to the sex pheromone emitted by the female according to the following mechanisms:

- THE MALES ARE UNABLE TO LOCATE THE FEMALE WHOSE NATURAL CALL IS "MASKED"
- HABITUATION OF THE NERVOUS SYSTEM
- THE MALE'S SENSORY RECEPTORS ARE SATURATED

## ADVANTAGES

- HIGHLY SPECIFIC AGAINST TARGETED INSECTS
- SAFE FOR USERS
- NO INTERFERENCE WITH OTHER BIOLOGICAL CONTROLS
- NO DAMAGE TO THE ENVIRONMENT

# TWIST - TIE MD<sup>2</sup> inPEST®

## COMPOSITION:

BLUE OR GREY SILICONE AND FERRITE

## SEX PHEROMONE:

(9Z,12E)-TETRADECA-9,12-DIEN-1-YL ACETATE (CAS: 30507-70-1)

## REGISTERED PRODUCT:

**BIOCIDE PRODUCT**

AUTHORIZATION NO.: FR-2020-0028

## TARGETED INSECTS:

*Plodia interpunctella* e *Epehstia kuehniella*

## ADDITIONAL TARGETED INSECTS:

*Epehstia elutella*, *Cadra cautella*,  
*Cadra calidella* e *Cadra figulilella*

## WHERE TO USE IT?

FOOD INDUSTRY, PRODUCTION AND STORAGE.

## HOW TO USE?

2 m of Twist-Tie MD2 inPEST® covers 600 m<sup>3</sup>.  
It can be directly installed on installations or structural elements, such as electrical conduits, shelves, pillars, by marking it with its warning sign. (vd pag.26).

TARGET PEST:

*Plodia interpunctella*

*Epehstia kuehniella*

NEW PACKAGING  
ENVELOPE WITH HERMETIC  
ZIP CLOSURE

**STRENGTHS:** String sold in 2 m skeins for greater ease of use during installation and replacement.  
EACH 2 m SKEIN covers a volume of 600 m<sup>3</sup>.

# ADVANTAGES:

Compared to other dispensers available on the market, it is a fully metal detectable instrument as ferrite, which gives it this property, is included in the holder.  
Detectability is a key requirement for BRC and IFS food safety standards.

Furthermore, once the total amount of linear metres of Twist Tie MD<sup>2</sup> to be used has been established based on the volumes to be treated (2 m of Twist-Tie MD<sup>2</sup> inPEST® saturates 600 m<sup>3</sup>), its special format ( Tie ) allows it to be portioned, by simple cutting. In this way, portions of the string can be distributed evenly throughout the room or concentrated around critical machinery or installations.

Another advantage of the Twist-Tie MD2 is its greater visibility compared to an ordinary dispenser, a feature that is not secondary in terms of the efficiency of the service provided to replace it once it is no longer operational.

# FOOD INDUSTRY CRAWLING INSECTS

## 3 Way Line Necrobia Line

Monitoring pests with specific traps lets obtain immediate feedback on the appearance of an infestation.

**inPEST** has designed a trap specifically for monitoring food industry beetles. This trap's shape grants access to insects, which are usually hard to catch, thanks to an innovative food based tablet integrating it with a multi-species pheromone dispenser.

### Good reasons to choose our "3way line":

- Easy to use: Just insert the cardboard trap in the plastic base and close with a simple "click"; the innovative, reusable cover protects the trap from dust and damp, guaranteeing efficacy of the adhesive surface for over a month.
- Easy to remove, it's impossible to get dirty!
- "Dust-proof" glue: the top and bottom adhesive surface of the cardboard trap is spread in parallel stripes in order to increase dust resistance.

### STORAGE CONDITIONS OF GLUE TRAPS:

Stored in a cool and dry place (lower than 25°C / 77°F and 55% R.H.) in their original packaging.

Products are guaranteed to perform correctly up to 3 years.

## FOOD INDUSTRY FLYING INSECTS

The images provided in this catalogue are purely indicative

# FOOD INDUSTRY FLYING INSECTS

## **inPEST's food industry flying insects monitoring line**

counts the largest number of glue traps and pit fall traps on the market.

Adhesives and materials used are specifically studied to give optimal results even in "extreme" situations such as dusty environments, damp environments or outdoors.

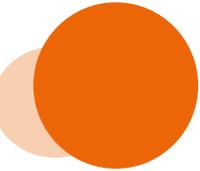

In combination with pheromone dispensers of the inPEST pheromone line, it is easy to check the presence of target insects in the monitored areas.

### **TARGET PEST:**

*Ephestia kuehniella, Plodia interpunctella, Lasioderma serricorne, Nemapogon granella, Tineola bisselliella, Tinea pellionella.*

### **STORAGE CONDITIONS OF GLUE TRAPS:**

Stored in a cool and dry place (lower than 25°C / 77°F and 55% R.H.) in their original packaging.  
Products are guaranteed to perform correctly up to 3 years.

## xTRAP DELTA

xTrap It is a monitoring device that can be activated with pheromones and attractants and is capable of detecting target insect captures via an integrated camera.

The data is available on the xFarm platform to monitor population trends and support timely and targeted control measures. xTrap Delta allows you to monitor remote areas of production facilities and critical points that are difficult to reach. Ideal for mechanized warehouses where pest control operators do not have access.

## METAL-DETECTABLE PRODUCTS

The images provided in this catalogue are purely indicative

# METAL-DETECTABLE PRODUCTS

## Dedicated line to the real IPM professionals

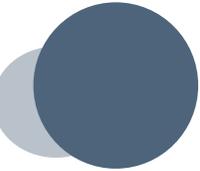

inPEST strives every day to offer its customers quality products that are ideal tools to allow PCO / Trained Professional to carry out effective interventions, respectful of both environment and current regulations. The ideal customer for this product line have professionalism and competence for an advanced IPM

## A line entirely detectable by metal detector.

The customer will find in these pages the most complete line of detectable by metal detector inPEST products for the Pest Control market. The Detectable Products Line is indeed, together with the Pheromones Line, the spearhead of inPEST. It is the result of years of Research & Development on products, innovation and experience in the market of professional devices for pest monitoring.

## All the advantages of ferrite.

Ferrite-enriched inPEST products offer PCO / Trained Professional enormous advantages during interventions, with a modestly higher cost than non-detectable products. The traceability and product's positioning control are great key elements during interventions and an inPEST product detectable by the metal detector guarantees easy traceability and positioning control. All thanks to ferrite. inPEST products have been made in such a way as to be detectable to the metal detector even only in really tiny part (if, for example, the product splinters) allowing to easily identify its position even if it is not intact. The use of this kind of products is strongly suggested, for example, in the food industries and in all those environments where is essential absolute control over the positioning of the products used for the intervention.

# CRAWLING INSECTS

## COCKROACHES, BED BUGS, SILVER FISH

In an **INTEGRATED PEST MANAGEMENT** program, one of the key points is understanding how infestation hotspots are distributed in the environment.

The **inPEST CRAWLING INSECTS LINE** offers a wide range of monitoring products, all made with high-quality materials, from cardboard to honeycomb plastic, which give the traps a longer than average lifespan. The excellent glues and new gel or tablet attractant formulations, combined with correct trap positioning, guarantee a high number of captures.

## MICE AND RATS

# MICE AND RATS

## WORK RESPONSIBLY.

The professional pest controller needs to become more and more aware of the fact that every time he/she uses tools for managing rodent infestations not only he/she affects the life of the target pest but also the one of non-target animals.

These non-target organisms may come into contact directly with the product or indirectly, for example when they get in contact with rodents that have been poisoned by rodenticides. This is why the use of glue, snap traps, live catch systems and rodenticides must be chosen and used with maximum care in order to reduce the risk of affecting non-target organisms.

A more conscious use of all the available rodent control tools will result in less suffering for pests and a more efficient long lasting result.

**inPEST** with its team of experts is engaged to raise awareness among its partners and customers of the importance of working according to these principles. In all those situations where the use of rodenticides is discouraged or forbidden, the use of glue boards (wooden glue boards, glue trays, cardboard glue boards, etc.) for managing rodents infestations is almost necessary.

The inPEST **MICE AND RATS GLUE BOARD LINE**, is designed with these principles in mind.

The numerous traps in the range guarantee multiple catches in any environmental condition.

This product line offers ideal solutions both in professional areas (such as food industries, warehouses, hospitals, etc.) and

urban areas such as condominiums, offices, homes etc. In an integrated pest management (IPM) program the combined use of glue traps and rodenticides allows the professional PCO to catch poisoned rodents before they die avoiding situations in which rotting carcasses remain lying unnoticed causing unpleasant drawbacks (bad odors, secondary infestations of saprophagous/ necrophagous insects etc.).

By placing the traps along the passageways of rodents, these will get caught while moving between their hiding place and their food

source. The inPEST mice and rats line includes also multiple catch stations, rodenticide bait boxes and snap traps to meet all different requirements.

## STORAGE CONDITIONS OF GLUE TRAPS:

IN THE FOLLOWING PAGES YOU WILL FIND BEST PRACTICES FOR THE RATIONAL AND RESPONSIBLE USE OF GLUE TRAPS: BY FOLLOWING THEM YOU CAN MINIMISE THE SUFFERING OF PEST RODENTS AND AVOID CATCHING NO-TARGETS.

## BEST PRACTICE DECALOGUE FOR A SUSTAINABLE HANDLING OF THE RODENT'S GLUES.

In this protocol we define the Rodent Glue Traps as "any surface covered by glue specifically used to trap rodents" and we consider the following points:

- 1 Assess the risk level: Before beginning to evaluate the possibility of other control methods, by suitability and results achieved in similar cases.
- 2 Only trained and competent professionals should be involved: responsible and certified PCOs
- 3 Frequent Monitoring: after no longer than 12 hours after installing the trap to minimize target's suffering and to release any no Target. Yet to be trained operators can do the monitoring but under direct responsibility of the Pest Manager. Glue traps should only be used indoor and never outdoor.
- 4 Need for a contingency plan: indicate a second person capable of carrying out all the work; if there are problems with the inspection schedule, the action must be suspended and the traps uninstalled, albeit temporarily.
- 5 Install traps of a size suitable for the target species and protected by appropriate covers.
- 6 Properly record all position, timing, catch, discharge data and keep them available and copied.
- 7 Suppress the target as quickly as possible (no drowning).
- 8 Protect non-target animals with devices properly positioned and covered with protective tunnels, as well as having suitable diluents and emollients available to properly release any trapped specimens, always in cooperation with specialists for the rescuing of non-target animals.
- 9 All devices must be removed at the end of treatments and recorded on the worksheet.
- 10 Proper disposal according to current regulations, keeping track of it in the project records.

## ILTs, LED UV TRAPS, UV TUBES AND GLUE BOARDS

# INSECT LIGHT TRAPS (ILTs), U.V. TUBES, LED AND GLUE BOARDS

By law foodstuffs must not be contaminated by external agents such as insects and other infestants. inPEST Insect Light Traps (ILTs) line offers electronic light trap with glue boards and U.V. tubes that lure flying insects and trap them preventing them from contaminating foodstuffs at the same time allowing PCOs to monitor these pests efficiently. To manage flying insects infestations the position of the insect light trap is not the only important thing to take into account, it is also very important to choose the right device for the area that needs monitoring. If devices are placed in the wrong way or are poor quality units they can give an unfounded sense of confidence making the situation worse.

### Target:

Flies, mosquitoes, wasps and hornets and all flying insects with positive phototropic response (i.e. attracted by light).

### POSITIVE PHOTOTROPISM SPECIES OF GREATEST INTEREST IN THE FOOD INDUSTRY

#### Lepidoptera - Food Moths

*Sitotroga cerealella* - *Plodia interpunctella*  
*Ephestia kuehniella* - *Ephestia cautella*  
*Nemapogon granella* - *Corcyra cephalonica*

#### Coleoptera - Food Beetles

*Tribolium castaneum* - *Tenebrio molitor*  
*Lasioderma serricornis* - *Stegobium paniceum*  
*Oryzaephilus surinamensis* - *Oryzaephilus mercator*  
*Rhyzopertha dominica* - *Antherenus spp.*  
*Attagenus spp.* - *Cryptolestes spp.*

#### Diptera - Fly, green and blue flyflies, carnaria fly

*Calliphora spp.* - *Lucilia spp.* - *Drosophila spp.*  
*Musca domestica* - *Sarcophaga carnaria*

#### Hymenoptera - Wasps and hornets

*Vespa crabro* - *Vespula spp.* - *Polysles spp.*

#### Hemiptera - Bugs

*Nezara viridula* - *Palomena prasina*  
*Halyomorpha halys*

The indicated coverage is indicative.

The area of effect of the U.V. fly killers may vary based on how objects are placed in the surrounding environment.

# INSECT LIGHT TRAPS (ILTs), U.V. TUBES, LED AND GLUE BOARDS

## LAMPADE U.V.

### FLY VARIO

Lamp in stainless steel and plastic.

It is equipped with 2 neon 15W lights shatterproof inPEST.

Can be used on the wall in multiple positions, or suspended.

Front inclination adjustable in **3 positions**.
